

## AJ CHEMICAL 345

### **A Series of Ultra-Concentrated Cold Flow Improvers for Distillate Fuels**

**ANTIGEL** fuel additives are available in a variety of concentrations to permit usage at ratios from 1:1,000 through 1:10,000.

**ANTIGEL** series serves as a simple, effective and economical means of producing a customized winter fuel, or of directly improving upon the limitations of any premixed winterized product – by providing these critical functions:

- ◆ Yielding cold flow properties superior to 30% kerosene blends
- ◆ Lowering Pour Point and Cold Filter Plugging Point
- ◆ Reducing icing tendency by controlling condensation and water buildup
- ◆ Extending cold flow operability by retarding the growth and congealment of wax crystals and by accelerating wax reliquification
- ◆ Permitting selective treatment of oils subject to extreme cold temperatures due to storage in outside tanks
